

Introduction

Theme Documentation

Thank you for purchasing this template. We've put in lots of love in developing this template and are excited that you've chosen this template. We hope you find it easy to use our template. This documentation guides you through the main features of the template and guides you on how to use and customize the template.

About the Template

Cryo is a Cryptocurrency Trading Dashboard. This template helps you build your cryptocurrency trading platform. This template build with rich features and a well-coded component. We use SASS and SMACSS to manage our CSS.

Need Help?

Please do not hesitate to get in touch with us if you need help. We also welcome your feedback and suggestions. Please contact us through our [Help center](#) and we are happy to help.

We usually respond to all queries within 24 hours during weekdays. We are mostly not available during weekends and public holidays. We live across different timezone and have different people for answering different queries. So if we find us online responding to other comments and not yours please be patient with us.

Installation

Last updated 4 minutes ago

Installation

This project was bootstrapped with [Create React App](#).

Available Scripts

In the project directory, you can run:

```
npm start
```

Runs the app in the development mode.

Open <http://localhost:3000> to view it in the browser.

The page will reload if you make edits.

You will also see any lint errors in the console.

```
npm test
```

Launches the test runner in the interactive watch mode.

See the section about [running tests](#) for more information.

```
npm run build
```

Builds the app for production to the `build` folder.

It correctly bundles React in production mode and optimizes the build for the best performance.

The build is minified and the filenames include the hashes.

Your app is ready to be deployed!

See the section about [deployment](#) for more information.

```
npm run eject
```

Note: this is a one-way operation. Once you `eject`, you can't go back!

If you aren't satisfied with the build tool and configuration choices, you can `eject` at any time. This command will remove the single build dependency from your project.

Instead, it will copy all the configuration files and the transitive dependencies (webpack, Babel, ESLint, etc) right into your project so you have full control over them. All of the commands except `eject` will still work, but they will point to the copied scripts so you can tweak them. At this point you're on your own.

You don't have to ever use `eject`. The curated feature set is suitable for small and middle deployments, and you shouldn't feel obligated to use this feature. However we understand that this tool wouldn't be useful if you couldn't customize it when you are ready for it.

Learn More

You can learn more in the [Create React App documentation](#).

To learn React, check out the [React documentation](#).
